

Host PC-EFT Overview

GLOBAL CARD SOLUTIONS

What is it?

Host PC-EFT is a suite of hosted Servebase payment solutions allowing merchants to process transactions globally* through all sales channels without the need to hold card data locally.

Host PC-EFT allows processing of both card present transactions using Chip and PIN processing and card not present transactions over the internet or via mail order or telephone.

Host PC-EFT uses a two part payment process for immediate authorisation followed by settlement of the transaction to the acquirer at the end of the trading day or as required.

Merchants have full access to their transaction data for viewing or reconciliation purposes, using the data reporting module which can be accessed securely over the internet.

Host PC-EFT includes a family of solutions to suit all your payment needs whilst at the same time addressing the security requirements required to ensure the safe and secure processing of all your card data.

PC-EFT Solutions

PC-EFT Payment Page is part of the Host PC-EFT family of solutions, allowing collection and real-time processing of web based transactions directly from your web site shopping basket application using a simple interface for capture of data.

PC-EFT Payment Page Professional is fully customisable application, allowing the merchant to maintain the look and feel of their website.

PC-EFT Virtual POS allows the capture and processing of card not present transactions directly into a hosted data entry screen, negating the need to store card details locally on the merchant's site.

Virtual POS is ideal for merchants with internet access, who require the ability to capture and process card data, quickly and easily directly into a browser based screen

PC-EFT IP allows merchants to securely integrate existing business applications directly to the Servebase Managed Payment Service, removing the need to host and maintain local payment servers or direct communications links to the acquirers from the merchant site.

PC-EFT POS allows merchants to process magnetic stripe and Chip and PIN transactions easily and securely over the internet without the need for local servers of additional communications lines.

PC-EFT POS provides an out of the box solution using a standard easy to integrate API which fully manages the Chip and PIN process between your point of sale application and your acquiring bank.

Why Servebase?

Servebase is a leading provider of global payment solutions. Our multi-channel capabilities provide customers with secure card processing covering all payment environments, from single solutions to multi channel combinations of mail order, e-commerce and customer present chip and PIN.
